

Contents of Condensed Matter Physics course

- Free-Electron Model of Metals

- a) The Sommerfeld free-electron theory of metals
- b) Free electron gas and its thermodynamic properties

- Simple Models of the Band Structure

- a) The Bloch theorem
- b) Energy levels in a periodic system
- c) The one Electron approximation
- d) The tight-binding approximation
- e) The Hartree-Fock approximation

- Quantum Theory of Lattice Vibrations

- a) Quantization of Lattice Vibrations
- b) Density of Phonon States
- c) The Thermodynamics of Vibrating Lattices

-Magnetically Ordered Systems

- a) Magnetic Materials
- b) Exchange Interactions
- c) Simple Models of Magnetism
- d) The Mean-Field Approximation
- e) The General Description of Magnetic Phase Transitions

-Transport Phenomena

- a) General Formulation of Transport Phenomena
- b) Boltzmann Equation
- c) Relaxation-Time Approximation

d) Transport Coefficients in Metals and Semiconductors

- Electron–Electron Interaction and Correlations

a) Simple Approximate Treatments of the Interaction

b) The Dielectric Function

c) Static Screening

-Density Functional Theory

a) Ground-state formalism

b) Approximate functionals

c) Current density functional theory

d) Time-dependent density functional theory
